Operations

Internal vs External frequency reference for frequency synthesizer

The L-band local oscillator frequency generated by the frequency synthesizer is frequency-locked onto a 10 MHz reference clock. The source of this 10 MHz reference clock (internal versus external) is user-selected by software commands.

In order to use the external frequency reference, connect a 10 MHz sinewave, clipped sinewave or square wave to the SMA connector J7. Then select external frequency reference by software command from the ComBlock control center.

In order to use the internal frequency reference, either physically disconnect the external 10 MHz signal at SMA connector J7, or place the external input signal in high impedance mode. Then select internal frequency reference by software command from the ComBlock control center.

Test Points

Test points are provided for easy access by an oscilloscope probe.

Test Point	Definition
TP1	Baseband signal, I-channel, at A/D converter input. The nominal amplitude is 1Vpp when the AGC loop is closed with the following demodulator (COM-1001, COM-1011, or equivalent).
TP2	Baseband signal, Q-channel, at A/D converter input. Nominal amplitude is 1Vpp when the AGC loop is closed.
PLL_LOCK	Frequency synthesizer PLL lock status. Active low: '0' when locked.
PLL_REF	Reference clock (10 MHz external or 20 MHz internal)

Performance

Internal Clock Reference

The internal crystal has a stability of +/- 50 ppm.

Low Pass Filter

Each A/D converter is preceded by a 4th order elliptic low-pass filter. The 3 dB cutoff frequency for model COM-3003-B (wideband applications) is 20 MHz.

COM-3003-B baseband low-pass filter frequency response. Span 100 MHz, 10dB/div.

The 3 dB cutoff frequency for model COM-3003-A (narrow band applications) is 265 KHz. In-band ripple within +/- 150 KHz is less than +/- 0.1 dB.

COM-3003-A baseband low-pass filter frequency response. Span 1 MHz, 5dB/div.

Phase noise

Typical phase noise performances (100 KHz step size) are:

- 50 dBc @ 100 Hz away from the carrier
- 65 dBc @ 1 KHz
- 75 dBc @ 10 KHz
- 100 dBc @ 100 KHz

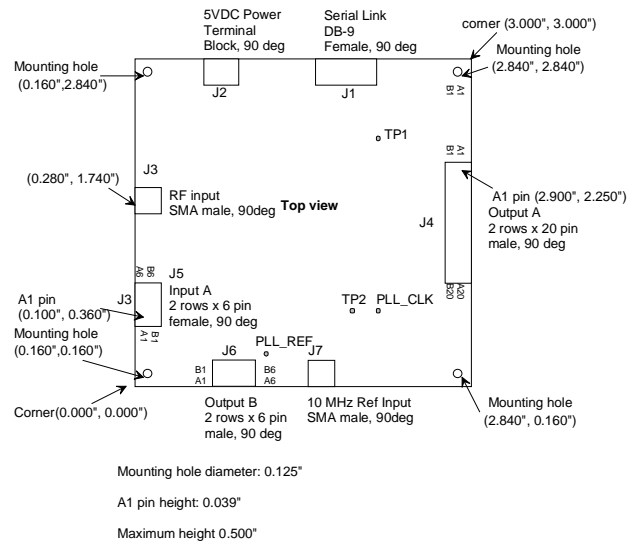

Typical close-in phase noise, 1 Hz resolution bandwidth, 400 Hz span, 5dB/div.

Spectral spurious lines are at -65 dBc or lower, with the exception of two spectral lines at +/- 100 KHz (-55 dBc).

LO frequency switching time: <2 ms
